Projects

Feasify | Project Manager, Lead Dev

- Architected a responsive React/Vite workspace with Tailwind and Recharts to automate 5-year financial projections, accelerating the feasibility study and proposal generation process from a 5–7 day manual grind to under 2 hours.
- Integrated the Gemini API with a local RAG pipeline via an Express backend, feeding local rubrics and financial domain knowledge to the model to flag critical business and formatting risks within 3 seconds of draft submission.
- Optimized Firestore real-time listener performance using query constraints and programmatic data-flattening, effectively keeping daily database operations safely under the 50,000 free-tier daily read limit.
- Engineered a real-time collaborative chat module deployed on Render using synchronized Socket.io and Firestore with localStorage caching, delivering messages in under 200ms for up to 5 concurrent users.
- Designed a responsive dashboard utilizing flexbox scroll-locking and dom-to-image rendering to generate multi-page executive PDF exports in under 3 seconds with a 100% layout retention rate across mobile and desktop.

Game Dev - Rise of the Bakunawa | Project Manager

- Led booth logistics, asset deployment, and player rotation during a high-traffic exhibition, onboarding 100+ active players to win 1st Place People's Choice over 28 competing teams.
- Orchestrated cross-functional workflows using Agile/Kanban via Jira and GitHub, stabilizing team velocity across 2 consecutive sprints to deliver major asset and code milestones exactly on schedule.
- Architected an iterative playtesting framework to balance game mechanics, managing a QA pipeline that identified 10+ critical bugs and recalibrated card attributes via manual match-testing sessions.
- Optimized the Unity asset integration pipeline for 3ds Max and Photoshop imports, enforcing texture and mesh constraints that eliminated engine crashes and locked a stable 60 FPS target.
- Directed the feature design of a mobile companion app for a physical TCG, eliminating complex manual scorekeeping by introducing a digital tracking architecture for turn phases and player health.

AttendScan | Lead Dev

- Programmed automated QR generation and database filters that seamlessly process attendance for over 7+ active classes simultaneously, completely eliminating duplicate student entry inputs.
- Architected a secure React and TypeScript web app using nested routing, allowing administrators to seamlessly switch between authentication pages and secure dashboards in under 100ms.
- Engineered a hybrid QR scanning module wrapping html5-qrcode for real-time camera streams, reducing average student check-in times to under 2 seconds with immediate client-side validation.
- Developed an optimized dashboard state system that caches student rosters, keeping complex data analytics responsive and lag-free for up to 350+ student records on low-end mobile devices.
- Programmed a one-click administrative export utility that processes raw attendance data into formatted CSV sheets in under 2 seconds for entire classroom rosters.

EDUCATION

Pamantasan ng Lungsod ng Valenzuela

Bachelor of Science in Information Technology

- 3rd Year Student
